ECE 640 Digital Signal Processing (Fall 2014)

Description: The fundamentals of signal theory and transforms are introduced in this course. The representation of signals in the time and complex domains are covered. Z-transform is presented and Laplace transform to Z-transform mapping techniques are studied. Fourier analysis tools for analog and discrete-time signals are developed and tied with popular engineering applications. Design techniques are introduced and digital filter design techniques are covered in this course. ***MATLAB*** use is a ***requirement*** for course assignments.
